

~~Reports recently show~~ There have been recent reports that the ~~deterioration and~~ development and exacerbation of ~~auto-immune~~autoimmune diseases, such as systematic lupus erythematosus and rheumatoid arthritis, may ~~have~~show seasonality, ~~despite with~~ the ~~fact that the season related~~seasonal characteristics ~~could vary~~ depending on the disease. Sunlight and infectious ~~pathogens~~agents are, ~~for example, thought to be involved with~~ examples of environmental factors ~~which contribute the that may be involved in the~~ occurrence of seasonality. In addition, ~~the an~~ association between ~~Vitamin~~vitamin D and ~~auto-immune~~autoimmune diseases ~~were~~was recently reported ~~recently~~ by Suzuki and colleagues. Although there ~~are some~~have been reports ~~indicating about~~ the ~~exacerbation/seasonal~~ development/exacerbation of ~~disease and seasonality in numerous~~ diseases, a ~~lot of disease, this seasonal~~ relationship is not consistent even among patients with the same disease ~~even~~. The reason ~~why is that for this may be~~ genetic factors ~~exist that differ~~ among individuals, ~~that there are as well as~~ environmental differences ~~due to such as variations in~~ climate, ~~etc, and that there is no agreed upon, or~~ the lack of established consensus definitions for the ~~development or relapsing of disease,~~ onset of or relapse of various diseases (including ~~its~~the duration and timing).
